## Planning Manual Part II: Risk-Informed Planning

2017-R-03

**Risk-Informed Planning Process**

## Planning Manual Part II: Risk-Informed Planning

PCOP Rollout Webinar

Charles Yoe  
August 17, 2017

# 7 Risk-Informed Planning Take Aways

1. There is a new risk-informed planning process figure but the planning steps are unchanged
2. Risk-informed planners reduce uncertainty wisely and iteratively
3. Everyone is a planner
4. Everyone is a risk manager
5. There is no such thing as “the number”
6. Residual risk and assessing the risk of the TSP are focal points
7. Tell effective stories, don't just dump data

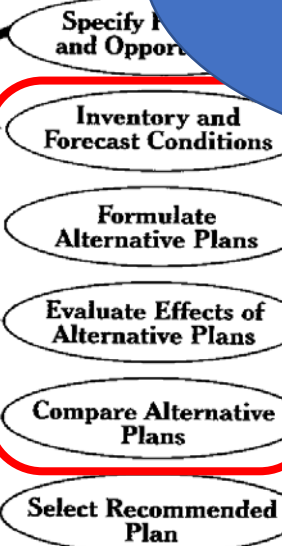

# New Process Figure

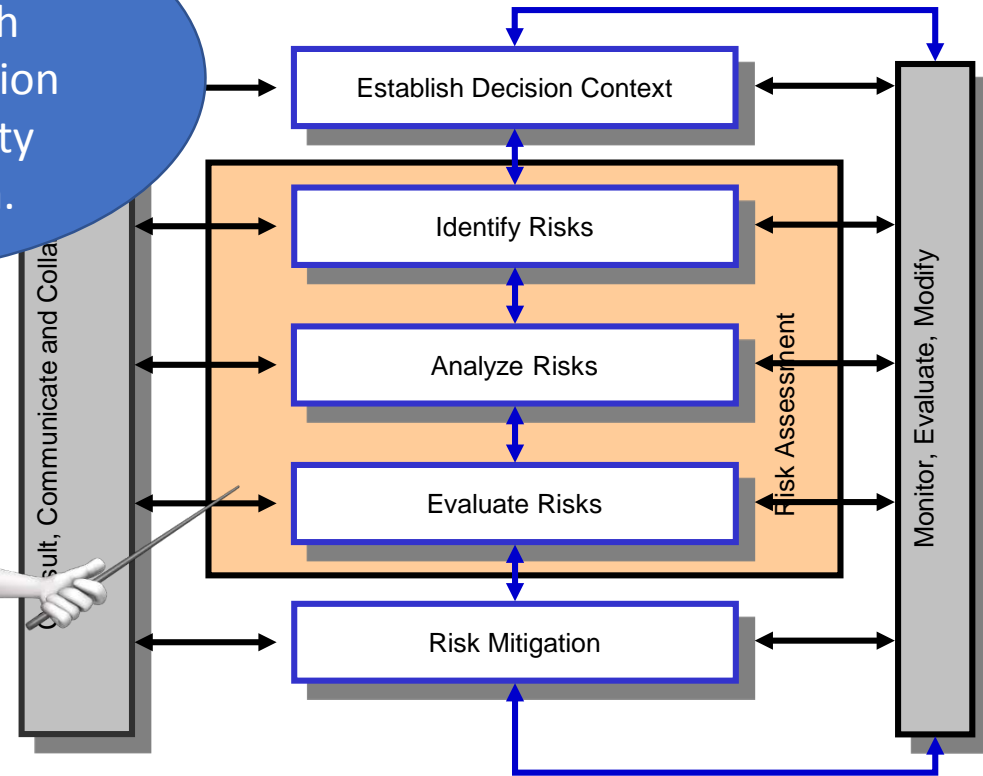

# Uncertainty Is The Biggest Reason

These steps ....

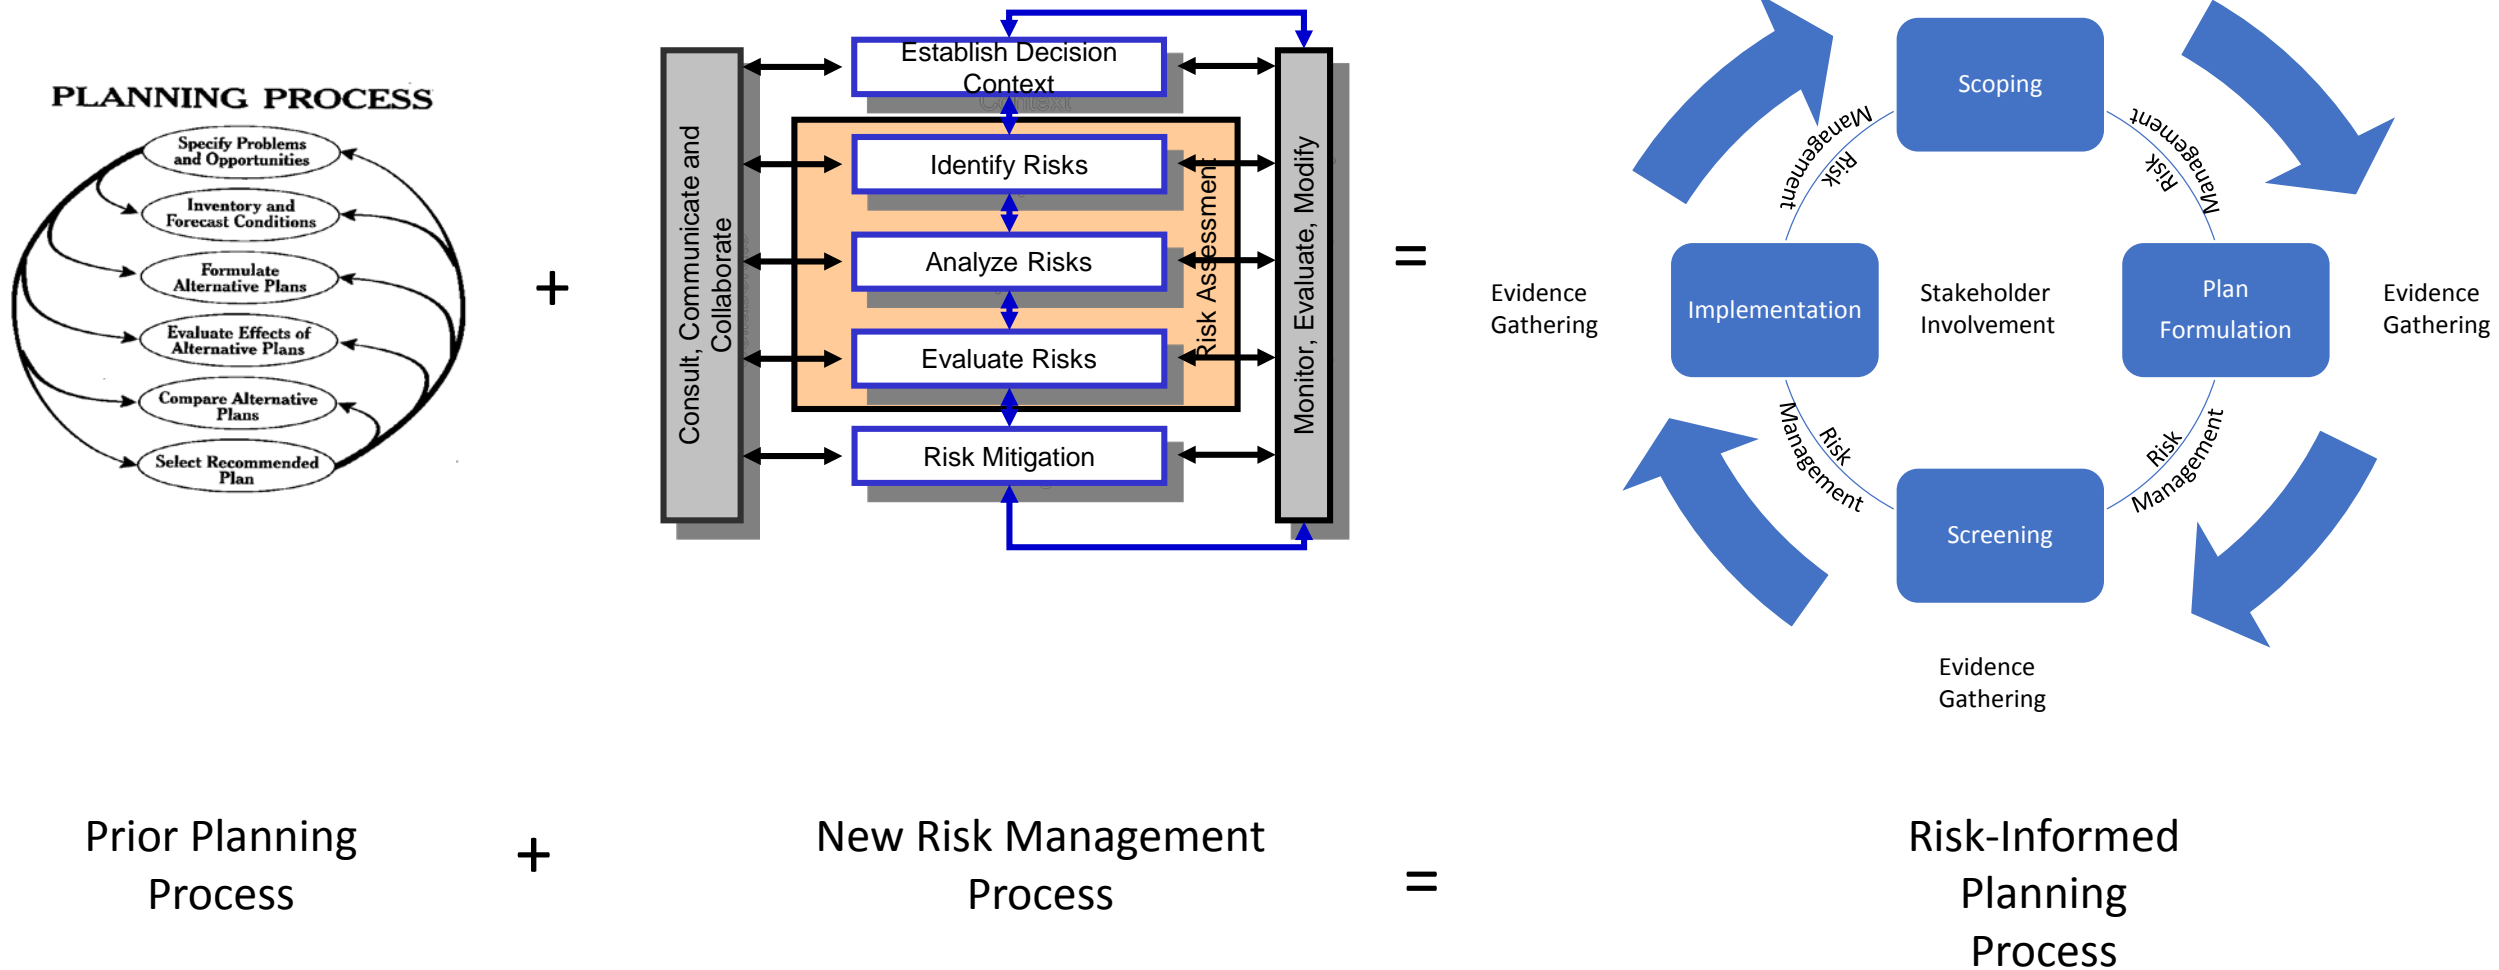

PLANNING

...are handled in risk assessment with intentional attention to the uncertainty attending them.

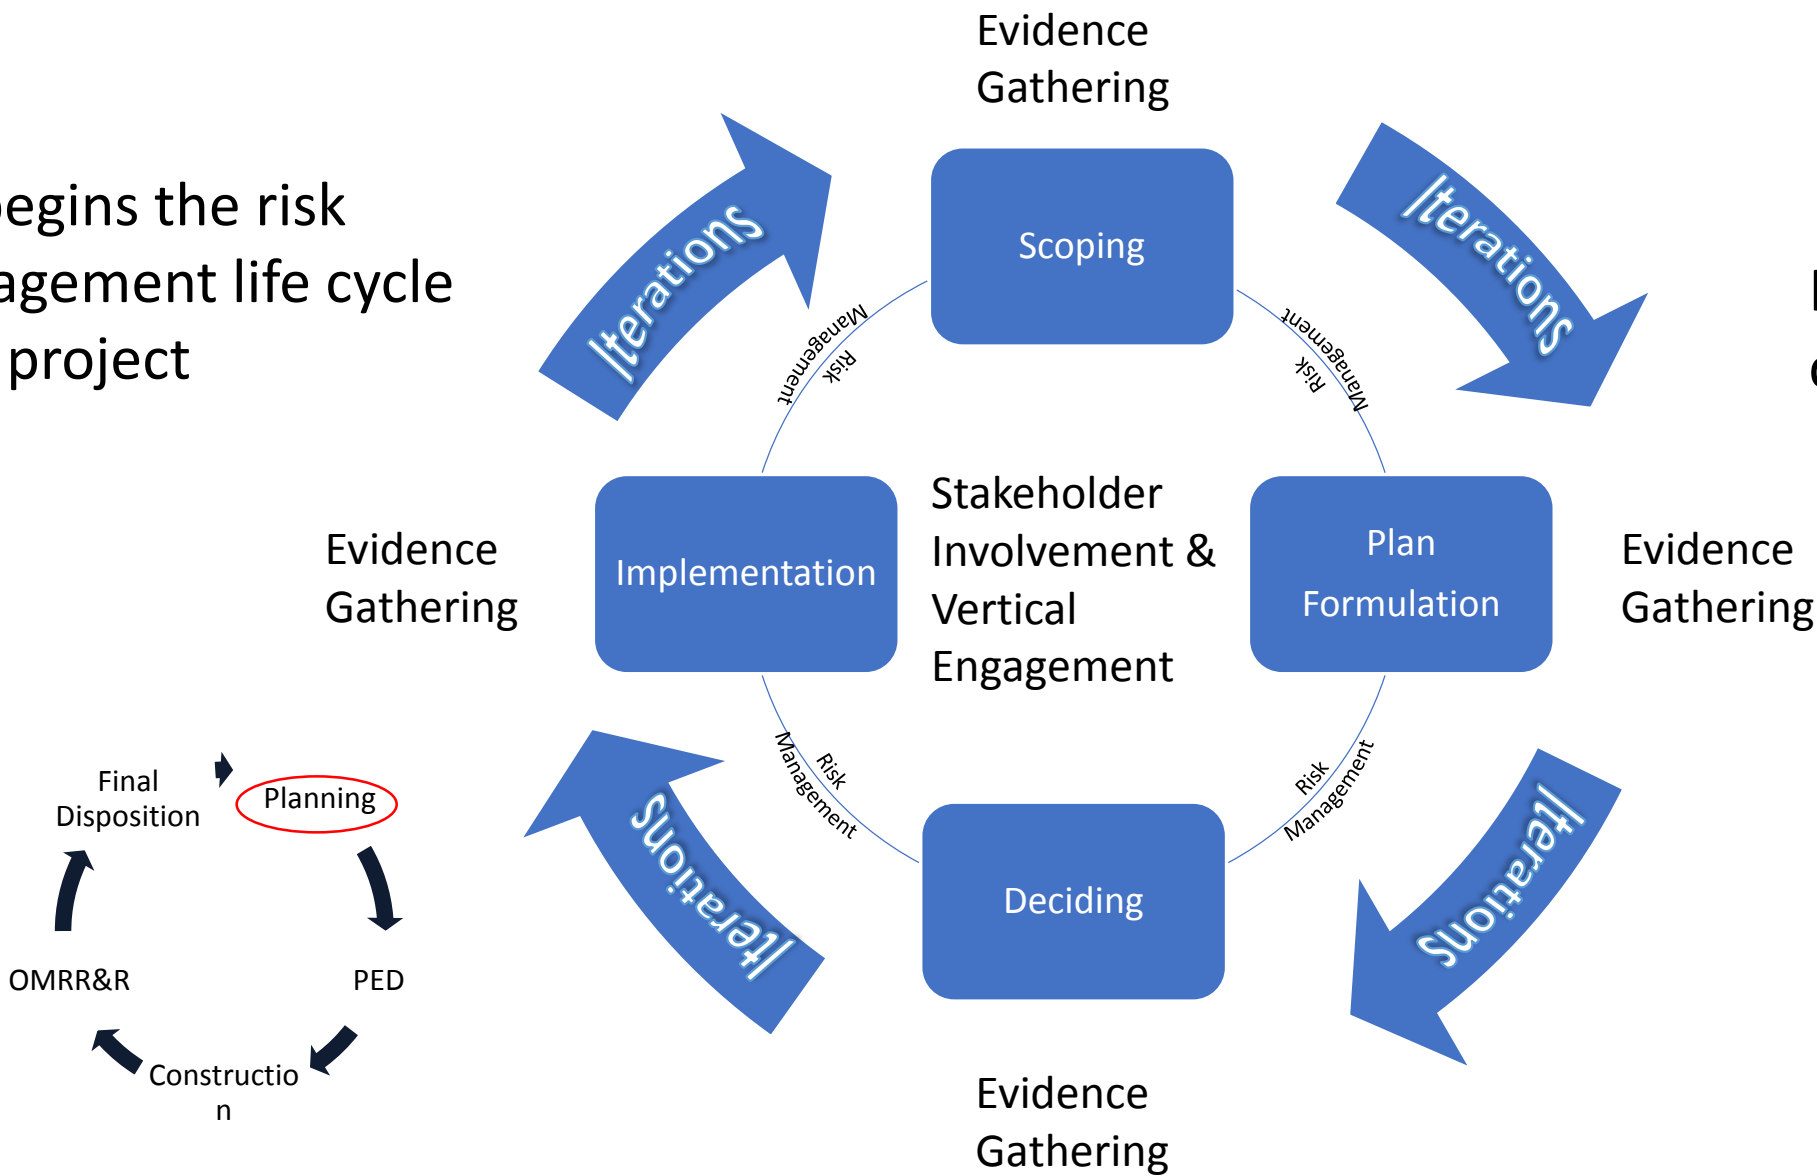

# Evolution Not Revolution

RIP begins the risk management life cycle for a project

It considers risks comprehensively

Reducing Uncertainty

Iterations of the planning process provide  
the best way to reduce uncertainty  
intentionally.

# 1<sup>st</sup> Iteration: Knowledge on the Team

Within 30 days

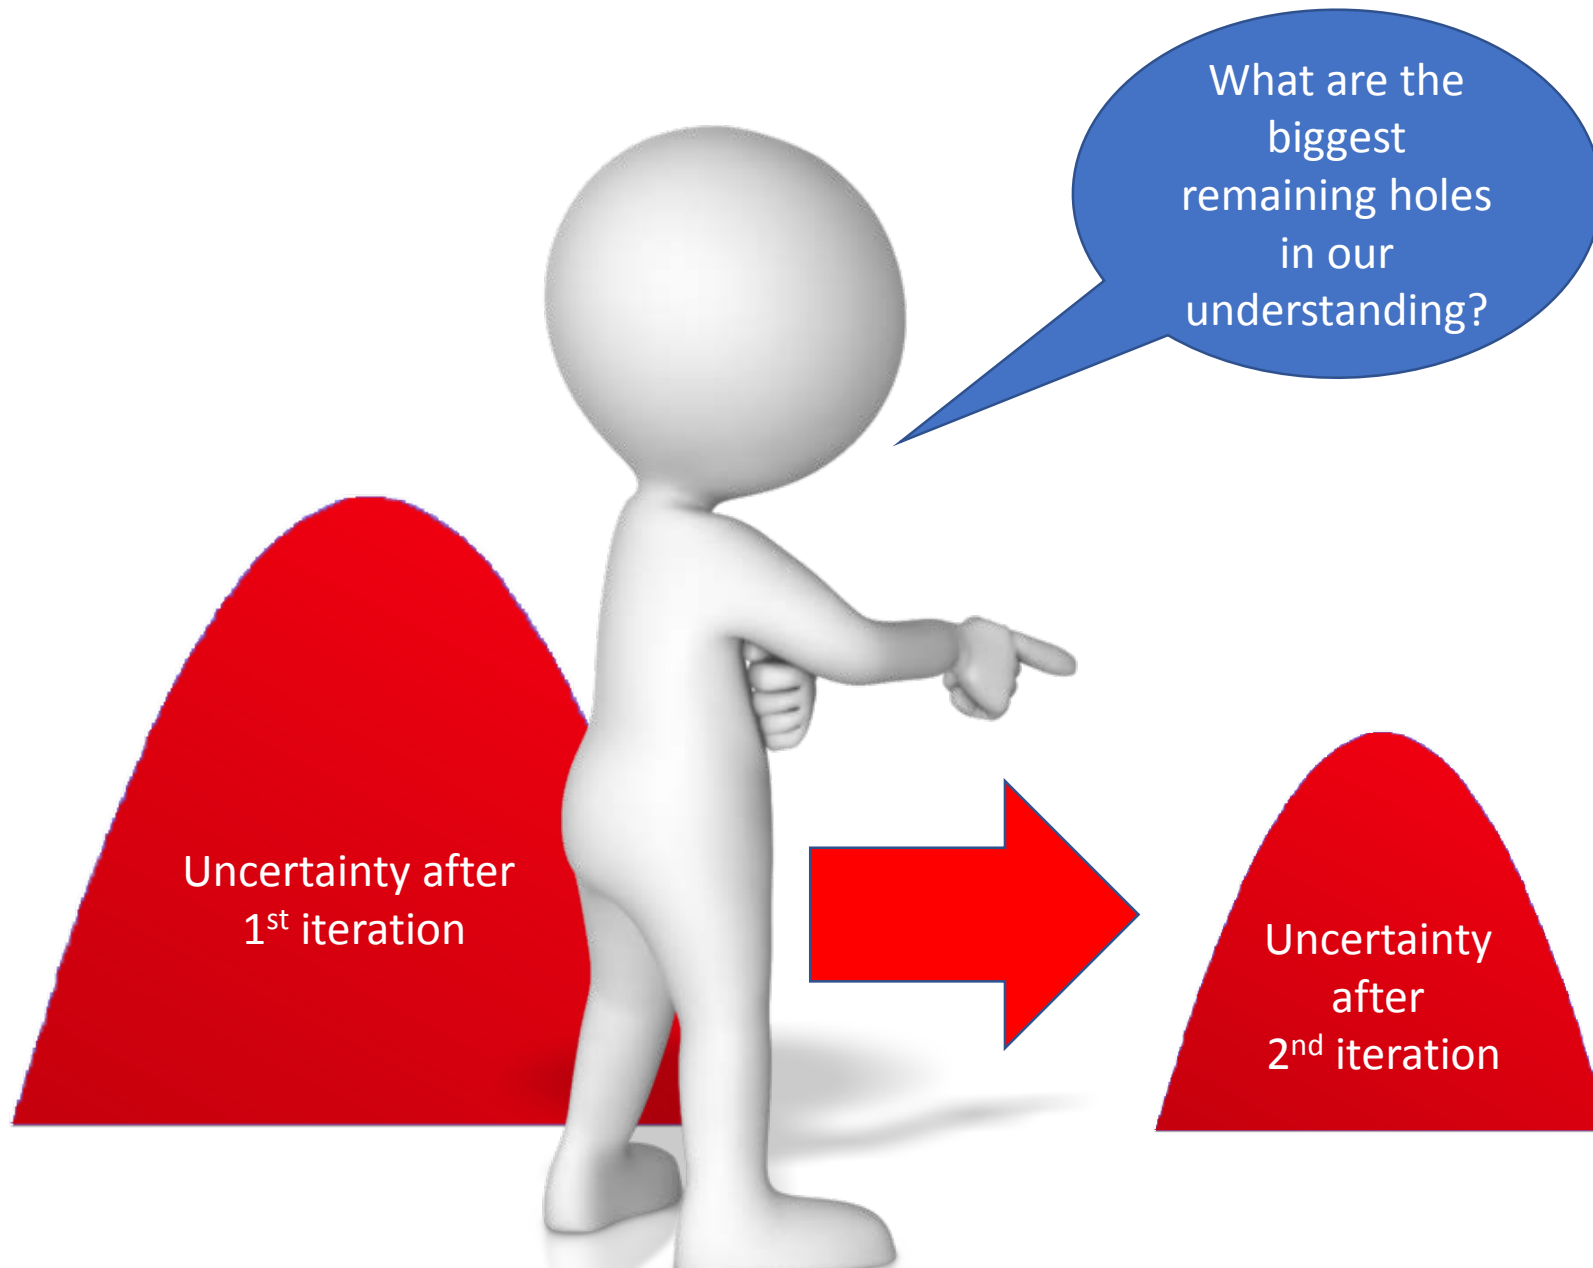

## 2<sup>nd</sup> Iteration: What Do Others Know

Within 90 days

# 3<sup>rd</sup> Iteration: What Must We Learn?

Within a year

Do I need a  
waiver?

Follow this process to a TSP  
and you will be 3x3x3  
compliant or you will have a  
strong case for why you  
cannot be.

# RIP Is Learning to Live With Uncertainty

There will always be  
some uncertainty.

At start

After 1<sup>st</sup> Iteration

After 2<sup>nd</sup>  
Iteration

After 3<sup>rd</sup> iteration

After TSP optimization

# Acquiring Evidence as Needed

You don't need all the evidence, just enough to make planning decisions.

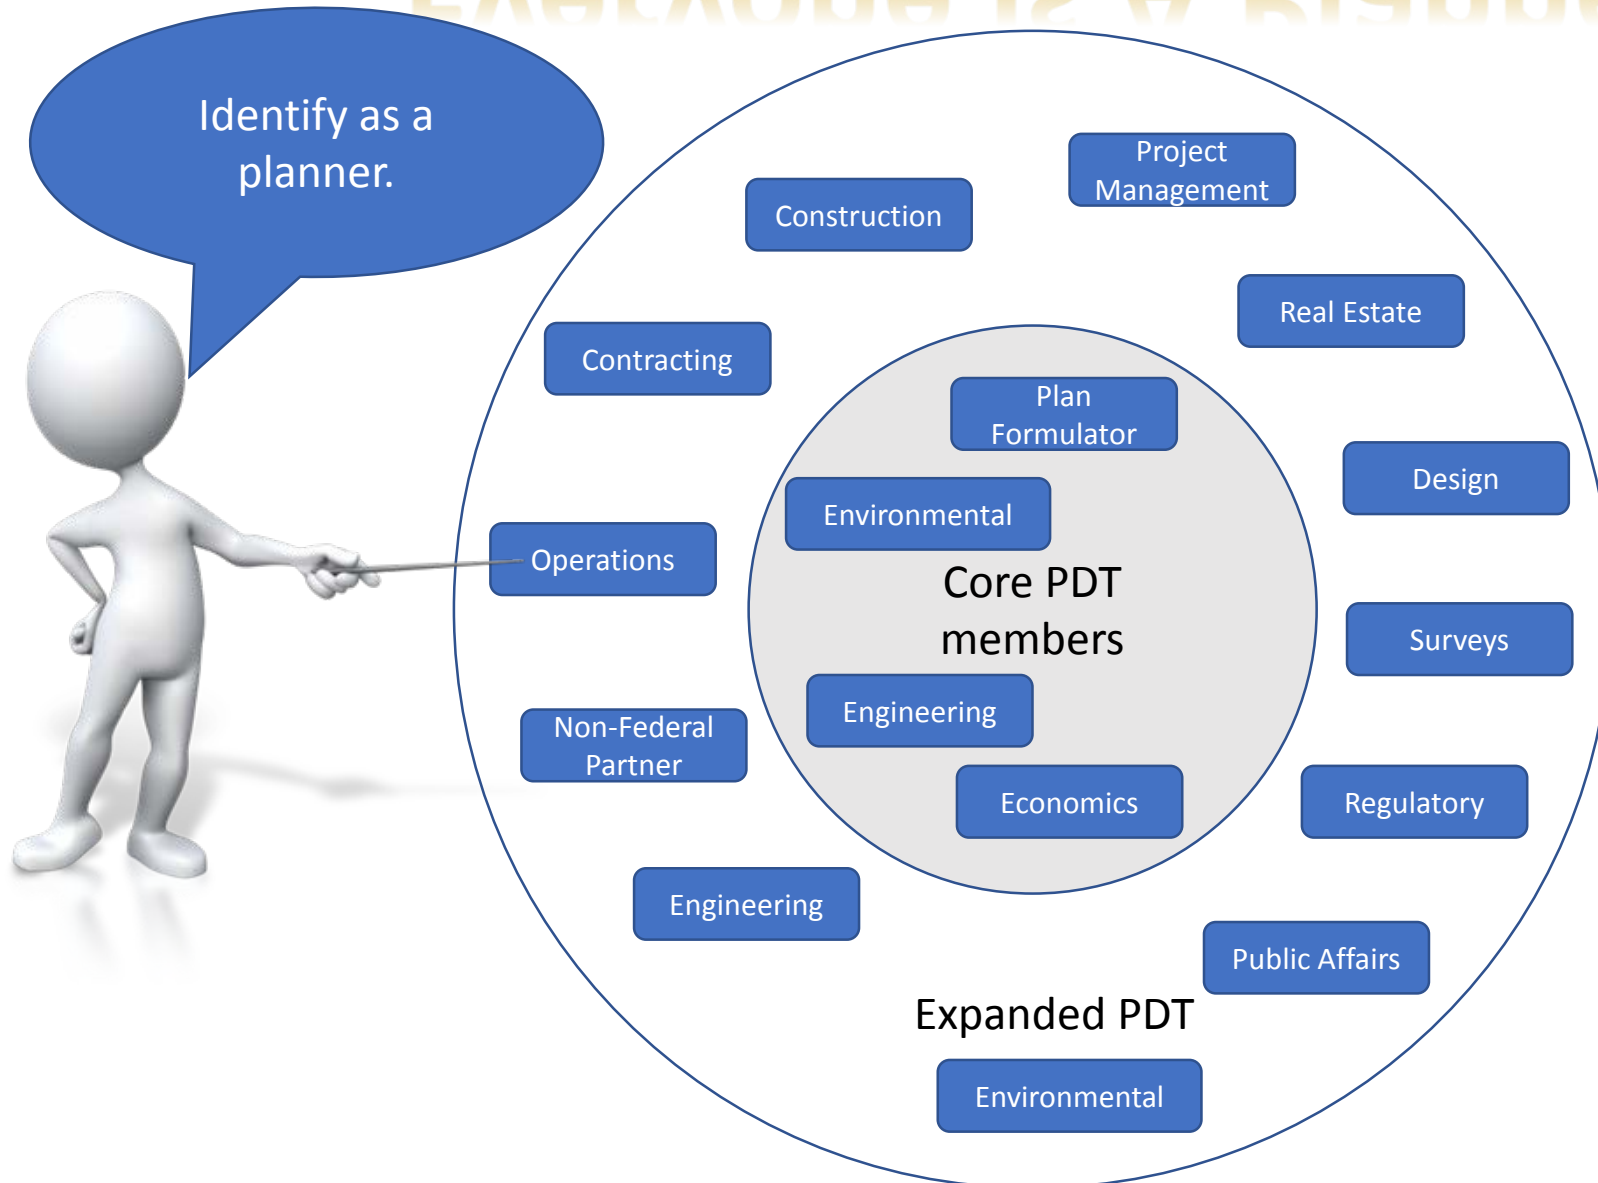

After 2<sup>nd</sup> Iteration

After 3<sup>rd</sup> iteration

After TSP optimization

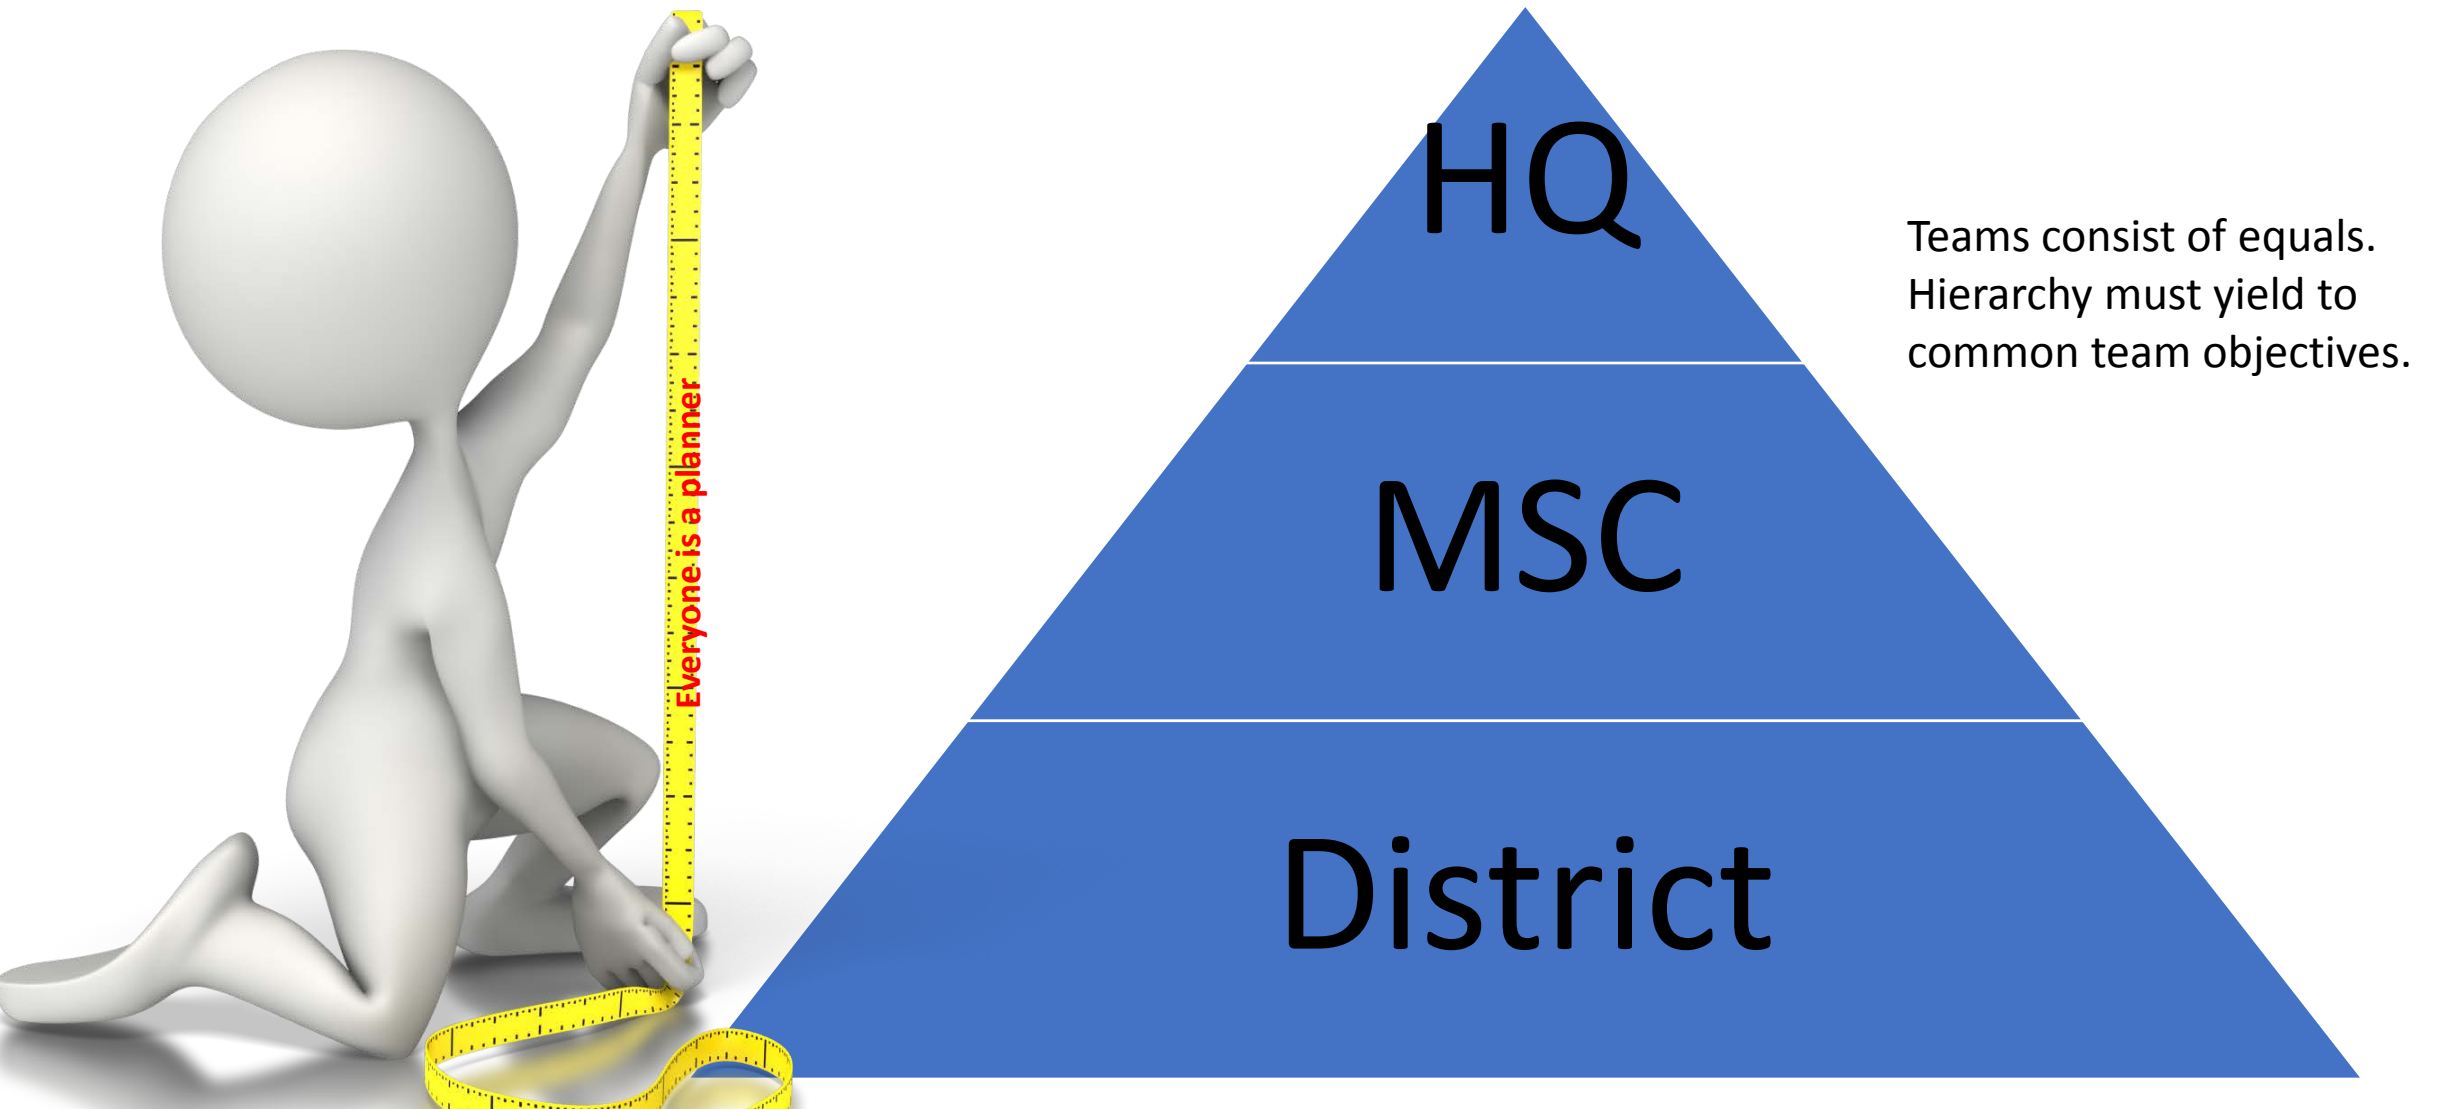

Everyone Is A Planner

# Everyone Is A Planner

If you identify only with your discipline and define yourself by that skillset, you become obsolete when challenges outside your discipline arise.

# The Entire Vertical Team Must Measure Up

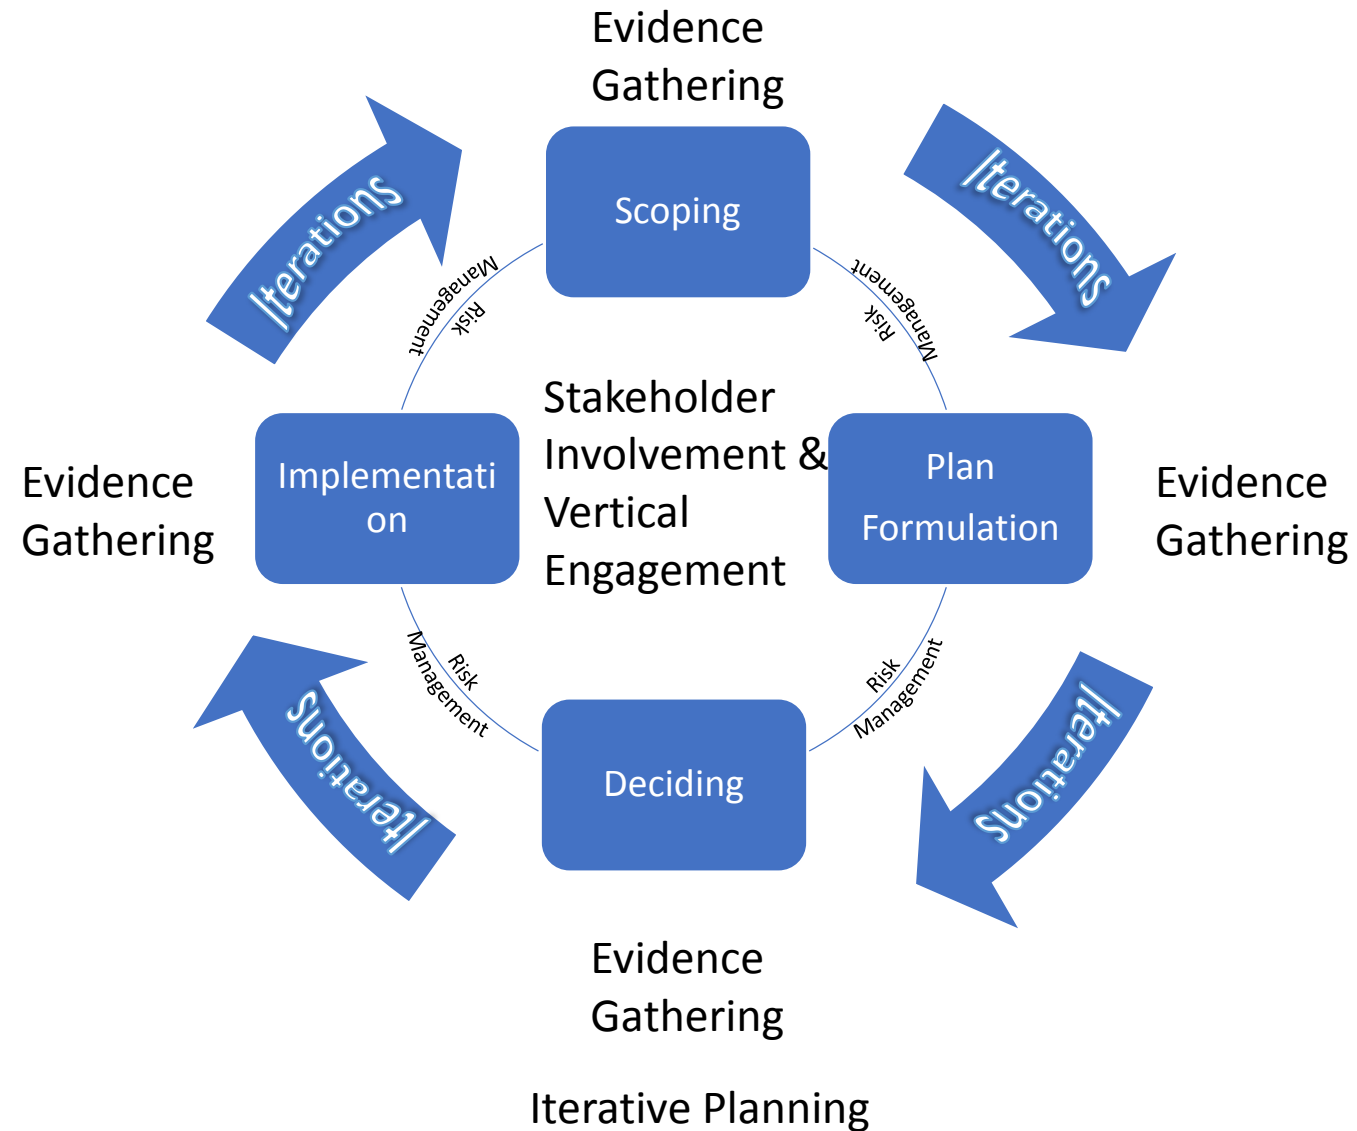

# Power Down Decision Making

Vertical Alignment

+

# Power Down Decision Making

=

More power for the PDT in making planning decisions

Risk Register is actively used as a management tool.

Risks are monitored and management is modified as needed

Everyone Is A Risk Manager

# Risk Register

- Risk management tool
- To be used by vertical team
- Someone must own each High and Medium risk
- Actively manage and monitor risks that result from conducting a study that is intentional about uncertainty

# Risk Register Sample

Scoping Choice or Event	Risk and its cause	Risk Type	Consequence	Consequence rating	Evidence for Consequence rating	Likelihood rating	Evidence for likelihood rating	Uncertainty rating	Risk Rating	Risk Management Options	Conclusion/Recommendation	Affected Study Component	Outcome	Notes
Conduct any physical model of the flushing lock concept during preconstruction engineering and design (PED).	The GLMRIS-BR Team has uncertainty in the efficacy and impacts of the flushing lock measure. In general, there are a limited number of measures that are believed capable of affecting the transfer of floating ANS, and the proposed flushing lock measure is one of the few and potentially the most acceptable determined by the findings of the GLMRIS-BR (2014). Based on 3-D modeling the flushing lock is believed to be implementable; however, if navigation is expected due to increased time needed to flush. Safety impacts are not anticipated because vessels would be tied up outside of the lock during flushing operations.	Poor Planning Decision	The GLMRIS-BR Team may not reduce the risk to the maximum extent possible by excluding other ANS controls that potentially target floating ANS.		If the measure is shown to be ineffective during physical modeling, the GLMRIS-BR Team would likely need to reformulate the proposed alternatives during the PED.		Likelihood of the consequence is medium since the team is basing its assumptions off of 3-D numeric			Perform physical modeling of the flushing lock concept prior to the TSP milestone. Tolerate the risk and		Economics, Eng. - General, Eng. - cost, Plan Formulation.		
The GLMRIS-BR Team is continuing with the consideration of an electric barrier as potential measure at BRLD, even though the extent of stray current and other associated issues will not be known until/if a barrier is installed and testing is performed.	The GLMRIS-BR Team recognizes that there be stray current issues associated with an electric barrier at BRLD, if recommended. This is based on stray current issues at the CSSC Electric Barrier.											Economics, Eng. - General, Eng. - cost, Plan Formulation, Real Estate.	The GLMRIS-BR Team will continue with the electric barrier as a measure, knowing there could be implementation problems.	It was noted that the risk management option was acceptable.
<div>4 High risk decisions</div> <div>28 Medium risk decisions</div> <div>19 Low risk decisions</div>														
The GLMRIS-BR Team may have a 15 minute flush for the BR Pool.	The GLMRIS-BR Team may have a 15 minute flush for the BR Pool.	Project Performance Risk	The GLMRIS-BR Team may have a 15 minute flush for the BR Pool.		The GLMRIS-BR Team may have a 15 minute flush for the BR Pool. Economics, Cultural Resources, Eng. - General, Eng. - Geotechnical, Eng. - H&M, Eng. - cost, Environment, Plan Formulation, Real Estate.		Use of previous design and coordination with current manufacturers was appropriate for this level of design. The features - complex noise, water jets - that we are least certain about are relatively low cost in comparison to the engineered channel and electric barrier.
A conceptual level of design was performed for the Technology Alternatives. Best available data was used including previous site investigations and design references from similar projects. No new site investigations were performed.	The risk is that the existing data used and professional assumptions made could be proven incorrect or inaccurate during later detailed designs.	Red	The risk is that the existing data used and professional assumptions made could be proven incorrect or inaccurate during later detailed designs. Ever risk has an owner

Hope is not a risk  
management strategy.  
Everyone is a risk  
manager.

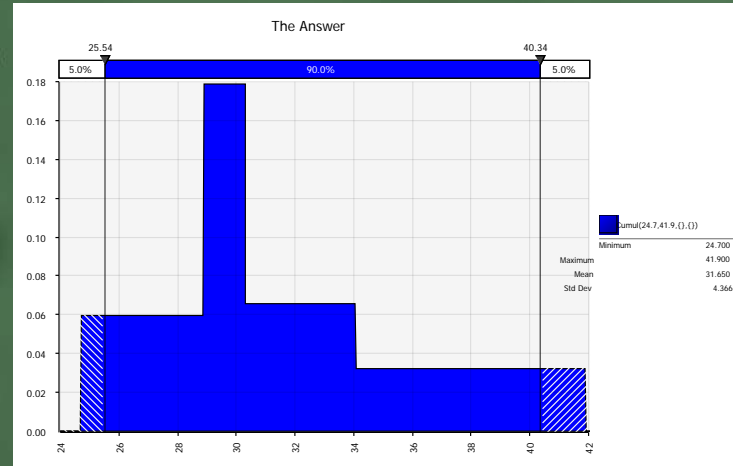

There Is No Such Thing As “The  
Number”

Yes. We will improve that estimate once we refine the TSP.

	1 <sup>st</sup> Q	Median	3 <sup>rd</sup> Q	Max.
24.7	28.9	30.3	34.1	41.9

Project  
Cost

So costs will be between \$25 and 42 million?

By reporting a single number, we hide our ignorance and keep our bosses ignorant of the limitations of our models and data. We need to be honest with them so they can openly account for uncertainty.

Net Benefits of Final Array

Decision making is different  
with uncertainty

# Residual Risk and TSP Risk Assessment

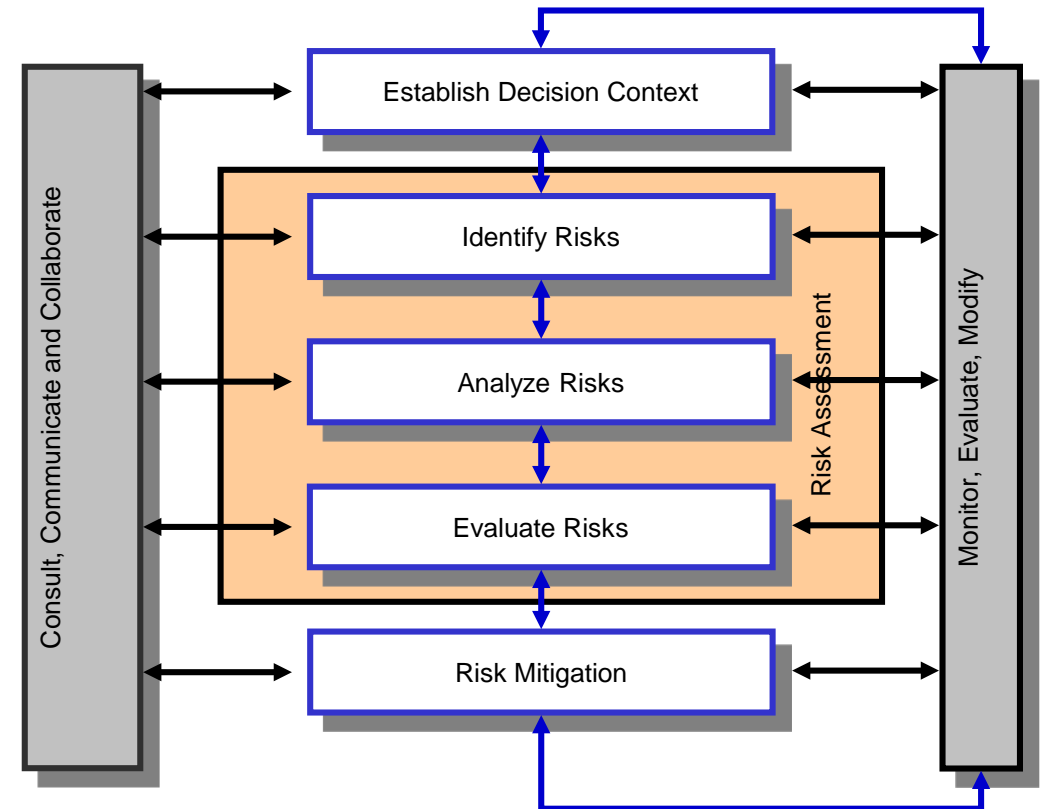

Carefully assess and describe the risk that remains with the TSP in place.

Residual Risk

# TSP Risk Assessment

- Conduct at least a qualitative assessment of the TSP
  - What can go wrong?
  - How can it happen?
  - What are the consequences?
  - How likely is it?
  - Carry risks forward to PED.

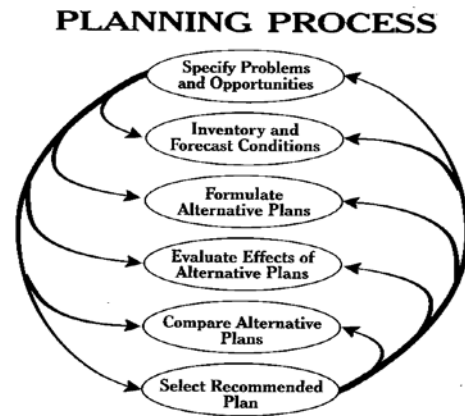

**Tell Stories**

# Tell Stories

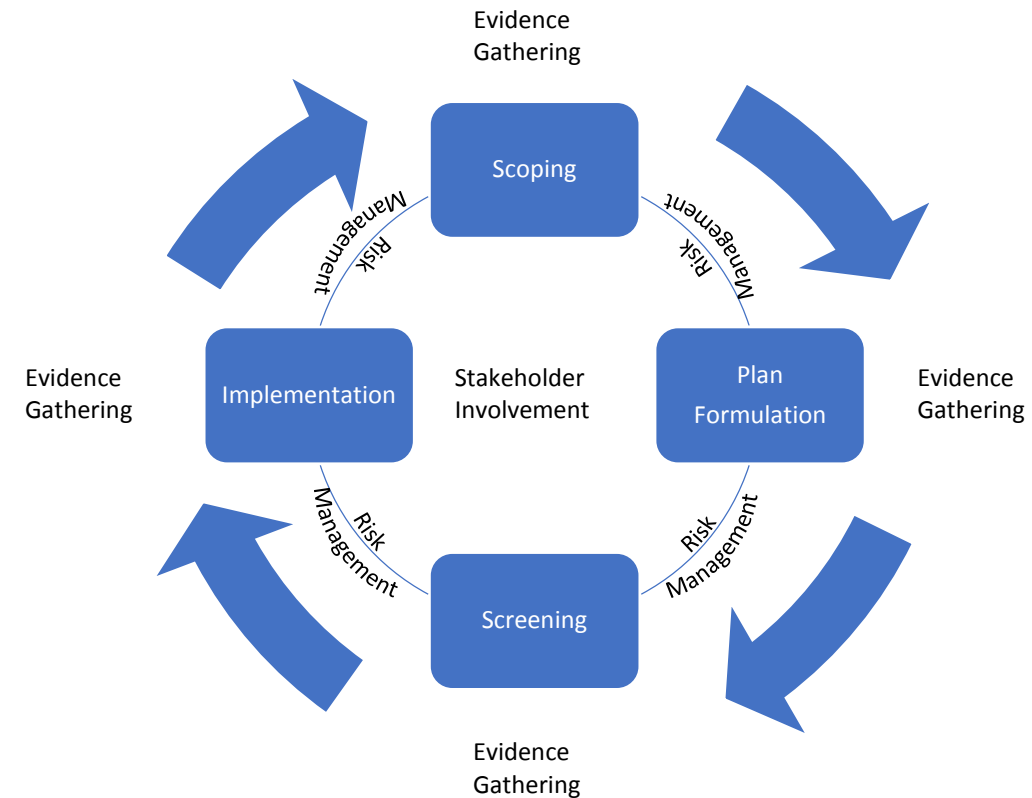

- Riskography with an engaging beginning, an interesting middle, and a satisfying ending
- More “why” less “how” and “what”
- No more six step structure, no data dumping
- Explain uncertainty
- Explore alternative media

# Be A Risk-Informed Planner

Bloated budgets  
Prolonged schedules  
Unhappy stakeholders

3 x 3 x 3  
Iterative  
Addresses uncertainty

# Discussion
